Example 1

Remote Laboratory Interface (RLI) showing network topology with nodes: sndr, rcvr, and UDP traffic.

Traffic graph showing Mbps vs time (secs). Legend: 1.1 tx, 2.1 rx, 2.4 rx, 1.4 rx, 1.3 rx.

Queue graph showing Bytes vs time (secs). Legend: 1,000 0.

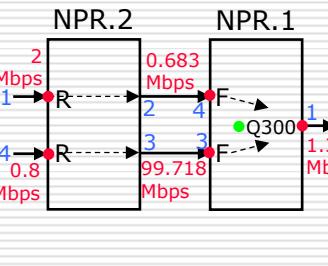

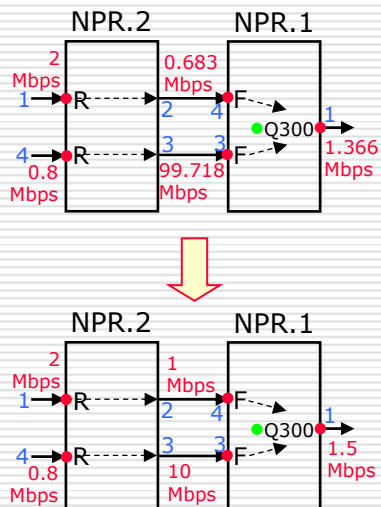

Diagram showing traffic flow between NPR.2 and NPR.1. Queue Q300 is highlighted. Traffic rates: 2 Mbps, 0.683 Mbps, 0.8 Mbps, 99.718 Mbps, 1.366 Mbps.

2 - Ken Wong - Oct 2008  Washington University in St. Louis

Example 1 (Modified)

Traffic

- » Max size pkts = 1500 bytes
- » n2p4 starts 10 sec after n2p1
- » n2p1: 2 Mbps = 167 pps
- » n2p4: 0.8 Mbps = 67 pps

Port Capacities

- » port 2/2:
- » port 2/3:
- » port 1/1:

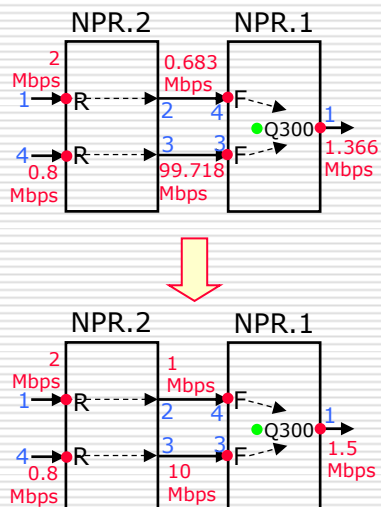

Queueing Rates

- » port 2/2:
- » port 2/3:
- » port 1/1:

Q300

- » Capacity: 100,000B
- » Overflows in sec

Example 1 (Modified)

Traffic

- » Max size pkts = 1500 bytes
- » n2p4 starts 10 sec after n2p1
- » n2p1: 2 Mbps = 167 pps
- » n2p4: 0.8 Mbps = 67 pps

Port Capacities

- » port 2/2: 1 Mbps = 84 pps
- » port 2/3: 10 Mbps = 840 pps
- » port 1/1: 1.5 Mbps = 126 pps

Queueing Rates

- » port 2/2: 2-1 = 1 Mbps
- » port 2/3: 0 Mbps
- » port 1/1: (1+0.8)-1.5 = 0.3 Mbps
 - 0.3 Mbps = 37,500 Bps = 25 pps

Q300

- » Capacity: 100,000B = 67 pkts
- » Overflows in 67/25 = 2.7 sec

Example 2 (Back-To-Back Traffic)

- Different Traffic
 - » back-to-back UDP pkts from n2p1 and n2p4
 - » both flows start at the same time
 - » n2p1: 100 max-size pkts (1500 bytes each)
 - » n2p4: 100 max-size pkts (1500 bytes each)
- What queues must be changed so that no pkt drops occur?

Example 2

- Different Traffic
 - » back-to-back UDP pkts from n2p1 and n2p4
 - » both flows start at the same time
 - » n2p1: 100 max-size pkts (1500 bytes each)
 - » n2p4: 100 max-size pkts (1500 bytes each)
- What queues must be changed so that no pkt drops occur?

- Transmission Volumes
 - » bytes from each source
 - » pragmatics: ONL UDP pkts
 - 8-byte UDP hdr, 20-byte IP hdr
 - 1470-byte UDP payload
 - → actual pkt size = 1498 bytes

- File transfer time

Example 2

■ Different Traffic

- » back-to-back UDP pkts from n2p1 and n2p4
- » both flows start at the same time
- » n2p1: 100 max-size pkts (1500 bytes each)
- » n2p4: 100 max-size pkts (1500 bytes each)

- What queues must be changed so that no pkt drops occur?

■ Transmission Volumes

- » bytes from each source
 - 150,000 bytes = 100x1500
- » pragmatics: ONL UDP pkts
 - 8-byte UDP hdr, 20-byte IP hdr
 - 1470-byte UDP payload
 - → actual pkt size = 1498 bytes

■ Q300 (NPR.1)

- » Capacity (for 2 flows)
 - 300,000 bytes = 200 pkts

■ Port 2/1, Datagram Queue

- » Capacity (for 1 flow)
 - 150,000 bytes = 100 pkts

■ File transfer time

- » 1.6 sec = (1.2+1.2)/1.5

Example 3 (Forward Delay)

■ Effect of 50 msec delay along forward path?

- » arrival of first pkt to n1p1
- » finish time

■ Interpacket Times

- » port 1/4:
- » port 1/3:
- » n1p1:

■ Bandwidth-Delay Products

- » n1p4-n1p1:
- » n1p3-n1p1:

Example 3 (Forward Delay)

- Effect of 50 msec delay along forward path?
 - » arrival of first pkt to n1p1
 - delayed by 50 msec
 - » finish time
 - 50 msec longer than without delay
- Interpacket Times
 - » port 1/4: $1/(84 \text{ pps}) = 11.9 \text{ msec}$
 - » port 1/3: $1/(8400 \text{ pps}) = 0.119 \text{ msec}$
 - » n1p1: $1/(126 \text{ pps}) = 7.93 \text{ msec}$
- Bandwidth-Delay Products
 - » n1p4-n1p1: $1 \text{ Mbps} \times 50 \text{ msec} = 50 \text{ Kb} = 33.3 \text{ pkts}$
 - » n1p3-n1p1: $10 \text{ Mbps} \times 50 \text{ msec} = 500 \text{ Kb} = 333 \text{ pkts}$

Example 4 (ACK Delay)

- Suppose
 - » Small ACK pkt returned along reverse path for each data pkt

ONL Issues

■ Port rate

- » Integer multiple of 0.683 Mbps
 - e.g., 12 Mbps → 11.611

■ Receiver socket buffer size

- » Default: 84 KB
- » Avoid ignoring incoming pkts for too long
- » Use `setsockopt()` to increase buffer size

```
n = 500 * 1500; // 500 max-size pkts
rc = setsockopt( sockfd, SOL_SOCKET, SO_RCVBUF, &n, sizeof(n));
```

■ C/C++ code examples (onlusr:~kenw/src/)

- » `pkt-pair/`
- » `xstcp/`

The Meaning of Port Rate

Queue Table → Port Rate

queue id	threshold(bytes)	quantum
default	32768	256
64	600000	1500

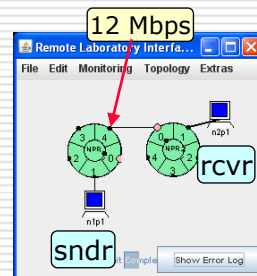

- Controlled by a token bucket model
 - » R: long-term average link rate (RLI parameter)
 - 54 Kbps granularity
 - » b: maximum bucket depth (4000 bytes)
 - » R': physical link rate (1 Gbps)
- Effect
 - » avg output rate is R
 - » peak rate is R'
- Operational definition
 - » fill token bucket at rate R
 - » transmit pkt when #tokens ≥ length of pkt at head of queue
- *Link regulator* model, NOT link emulator

The Packet-Pair Problem

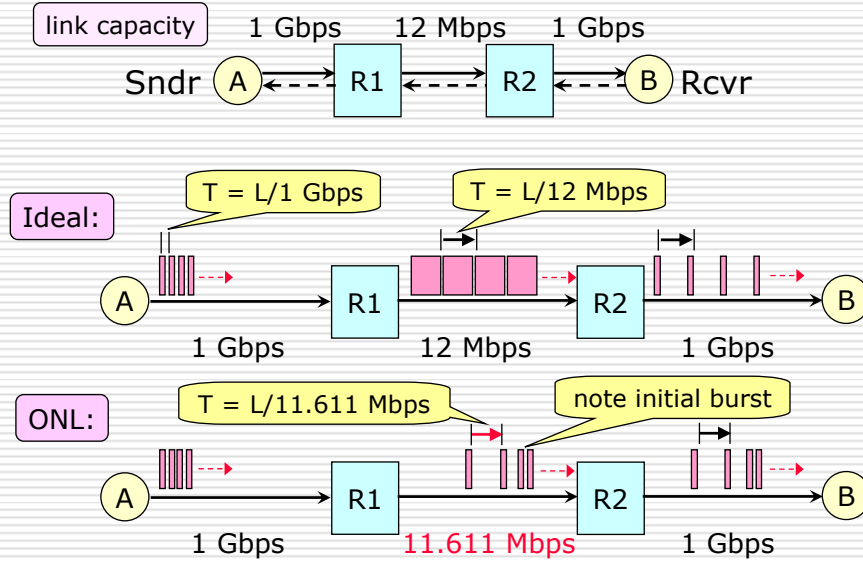

- Keshav's idea
- Rcvr receives the two pkts at times t_0 and t_1
 - » What will the *interpacket time* $t_1 - t_0$ be?
 - » *average interbit time*?

ONL Experiment:

ONL Packet-Pair Experiment (1)

ONL Packet-Pair Experiment (2)

```

onl
onlusr> source ~/onl/.topology
bash: export: `NPR.1=NPR.9`: not a valid identifier
bash: export: `NPR.2=NPR.10`: not a valid identifier
onlusr> ssh $n2p1
Last login: Wed Oct 8 16:22:35 2008 from onlusr.arl.wustl.edu
onl052> cd src/pkt-pair
onl052> pp-rcvr
    
```

Puts \$n1p2, etc. into Linux bash environment

```
